

$$\text{Dans notre cas : } I_{z'(Anse \cup)} = \frac{1}{2} \left[\underbrace{\left(\frac{\rho \pi a (b)^4}{2} - \rho \pi a \frac{(b-a)^4}{2} \right)}_{\frac{I_{x'(Anse O)}}{2}} + \underbrace{\left(\rho \pi a \frac{a^2 b^2}{12} - \rho \pi a \frac{a^2 (b-a)^2}{12} \right)}_{I_{y'z'(Anse O)}} \right]$$

$$I_{z'(Anse \cup)} = I_{z'(Anse \cup)} + \underbrace{\left(\rho \pi a (b^2 - (b-a)^2) \left(-d_G^2 + \left(\frac{D}{2} + d_G \right)^2 \right) \right)}_{\text{Steiner}} \quad \text{où } d_G = \text{distance(axe } z'; \text{ cdm de l'anse)}$$

$$I_z = \frac{\rho \pi H}{2} \left(\left(\frac{D}{2} \right)^4 - \left(\frac{D}{2} - e \right)^4 \right) + \frac{\rho \pi a}{4} \left((b)^4 - (b-a)^4 \right) + \frac{\rho \pi a^3}{12} (b^2 - (b-a)^2) + \rho \pi a (b^2 - (b-a)^2) \left(\frac{D}{2} \right)^2$$

3. $T = \frac{1}{2} m v_G^2 + \frac{1}{2} \bar{\omega} \bar{I}_G \bar{\omega} = \frac{1}{2} m \left((\dot{x} + R\dot{\theta})^2 + x^2 \dot{\theta}^2 \right) + \frac{1}{2} \frac{m R^2}{2} (\dot{\theta} + \dot{\phi})^2 \quad \text{et } V = -mg(x \cos \theta - R \sin \theta)$

avec $\bar{\omega} = (\dot{\theta} + \dot{\phi}) \bar{1}_z$; $\bar{OG} = x \bar{1}_{x_1} + R \bar{1}_{y_1} \Rightarrow \bar{v}_G = (\dot{x} - R\dot{\theta}) \bar{1}_{x_1} + x \dot{\theta} \bar{1}_{y_1}$

Condition de roulement sans glissement :

$$\left. \begin{aligned} \bar{v}_{P \in \text{corde}} &= x \dot{\theta} \bar{1}_{y_1} \\ \bar{v}_{Q \in \text{disque}} &= \frac{d(x \bar{1}_{x_1} + R \bar{1}_{y_1} + R \bar{1}_{y_2})}{dt} = \dot{x} \bar{1}_{x_1} + x \dot{\theta} \bar{1}_{y_1} - R \dot{\theta} \bar{1}_{x_1} - R(\dot{\theta} + \dot{\phi}) \bar{1}_{x_2} \underset{\substack{\text{quand} \\ Q=P}}{=} \dot{x} \bar{1}_{x_1} + x \dot{\theta} \bar{1}_{y_1} + \dot{\phi} \bar{1}_{x_1} \end{aligned} \right\} \Rightarrow \dot{x} = -R\dot{\phi}$$

$$L = T - V = \frac{1}{2} m \left((\dot{x} - R\dot{\theta})^2 + x^2 \dot{\theta}^2 \right) + \frac{1}{2} \frac{m R^2}{2} \left(\dot{\theta} - \frac{\dot{x}}{R} \right)^2 + mg(x \cos \theta - R \sin \theta)$$

$$\left\{ \begin{aligned} x : m(\ddot{x} - R\ddot{\theta}) - \frac{mR}{2} \left(\ddot{\theta} - \frac{\ddot{x}}{R} \right) - m x \dot{\theta}^2 &= mg \cos \theta \Rightarrow \frac{3}{2} \ddot{x} - \frac{3}{2} R \ddot{\theta} - x \dot{\theta}^2 = g \cos \theta \\ \theta : m(x^2 \ddot{\theta} + 2x \dot{x} \dot{\theta} - R(\ddot{x} - R\ddot{\theta})) + \frac{m R^2}{2} \left(\ddot{\theta} - \frac{\ddot{x}}{R} \right) &= -mgx \sin \theta - mgR \cos \theta + > x \ddot{\theta} + 2\dot{x} \dot{\theta} - R \dot{\theta}^2 = -g \sin \theta \end{aligned} \right.$$

Théorème de la résultante cinétique : $\left\{ \begin{aligned} m(\ddot{x} - R\ddot{\theta} - x \dot{\theta}^2) &= mg \cos \theta - T \\ m(\dot{x} \dot{\theta} + x \ddot{\theta} + \dot{x} \dot{\theta} - R \dot{\theta}^2) &= -mg \sin \theta \end{aligned} \right.$

Théorème du moment cinétique : $\frac{m R^2}{2} \left(\ddot{\theta} - \frac{\ddot{x}}{R} \right) = -RT$

Condition initiale pour que la corde reste verticale :

$$\theta(0) = 0 \quad \text{et} \quad \dot{\theta}(0) = 0 \Rightarrow \ddot{x} = \frac{2}{3} g$$

4.
$$\bar{M}_0 = \bar{I}_0 \bar{\omega} = \begin{pmatrix} \frac{3mR^2}{20} + \frac{3mH^2}{80} + m d_{OG}^2 & - & 0 \\ 0 & - & 0 \\ 0 & - & \frac{3mR^2}{20} \end{pmatrix} \begin{pmatrix} \omega \sin \alpha \\ 0 \\ \omega \cos \alpha \end{pmatrix}$$

$$\bar{M}_0 = \left(\frac{3mR^2}{20} + \frac{3mH^2}{80} + m d_{OG}^2 \right) \omega \frac{R}{\sqrt{R^2 + H^2}} + \frac{3mR^2}{20} \omega \frac{H}{\sqrt{R^2 + H^2}}$$

5. Par le théorème du moment cinétique : conservation du moment cinétique

$$\frac{d}{dt} \bar{M}_0 = 0 \Rightarrow \bar{M}_0^+ = \bar{M}_0^- \Rightarrow \frac{M_1 R^2}{2} \omega_1 - \frac{M_2 R^2}{2} \omega_2 = \frac{(M_1 + M_2) R^2}{2} \omega$$

$$\frac{M_2 R^2}{6} 4\omega_2 - \frac{M_2 R^2}{2} \omega_2 = \frac{(M_2 + 3M_2) R^2}{6} \omega \Rightarrow \omega = \frac{\omega_2}{4}$$

Pourcentage de l'énergie cinétique : $\frac{T^+}{T^-} = \frac{\frac{M_1 R^2}{2} \omega_1^2 + \frac{M_2 R^2}{2} \omega_2^2}{\frac{(M_1 + M_2) R^2}{2} \omega^2} = 1,32\%$
